in the Finnish Adoption Study of children at high risk for schizophrenia, it was associated with schizophrenia spectrum disorders. Gottesman (1991) cites another example. While the relationship of some illicit drugs to psychosis remains a matter of scientific debate for the population at large, some such drugs (including amphetamines, LSD and PCP) do involve the same dopamine pathways that have been implicated in schizophrenia. So the person with a family genetic history of psychosis may be at much higher risk than their peers due to exposure to these drugs.

To these two I would add two other closely related questions:

Just what is he/she at risk of?

While the family thinks of psychosis and often the most negative end of that with chronic disability, the reality can be quite different. The person at risk may have some of the schizophrenia spectrum symptoms or hypomania, so that they are 'different', but still capable of living a good life. Even if the person does become psychotic, genetics does not appear to be able to predict the severity of the illness. While another relative may have had an unremitting illness, the next family member diagnosed may have one episode and thereafter manage well.

Understanding and explaining the genetics of mental illness

Read

usual age for the onset of prodromal signs. There certainly are reports of earlier differences in everything from social behaviour to reading ability, but these tend to be statistical differences between two groups of children, rather than anything that would warrant a formal prediction for an individual child. The situation is complicated by factors in the child and in the parent. The child may have had much experience of adults with mental illness and may be imitating their behaviour or reacting to it. If their ill parent rarely interacted with them, then there may well be some limitations in the children's social behaviour towards others. At the same time, a parent who grew up with an ill parent may have less knowledge of 'normal' child development. I remember a mother whose own mother had experienced psychosis finding it difficult to believe that her three year old's 'imaginary friend' was part of normal development and not the first signs of psychosis!

What can we do to reduce the risk?

Our knowledge of environmental risk factors is remarkably poor, and includes such factors as pregnancy and delivery complications (Tsuang, 2000) which most would not regard as environmental. Both Tsuang (2000) and Gottesman (1991) differentiate between what may be an environmental risk factor across the entire population and one which may only come into play in the presence of a genetic predisposition. So while a dysfunctional family environment does not 'cause' schizophrenia in the general population, in the Einrich Adoption Study of children at high right for achievements it

Parental Attachment, Cognitive Working Models, and Depression Among African American College Students

Keisha M. Love and Tamera B. Murdock

In an attempt to understand the cognitive mechanisms by which parental attachments predict depression among African American college students, the authors examined a mediational path model containing parental attachment, cognitive working models, and depression. The model demonstrated a close fit to the data, and several significant paths emerged. The authors provide recommendations for counselors practicing in college counseling centers and suggest directions for future research.

Keywords: attachment, working models, depression, African Americans, college students

ounselors strive to promote emotional well-being by equipping clients with the tools necessary to mitigate daily life stressors (Gelso & Fretz, 1992). To do this, counselors must have an understanding of factors that buffer emotional distress (e.g., depression) to develop interventions that will foster emotional well-being. Attachment theory is a commonly used theoretical framework that researchers and clinicians have used to explain emotional well-being among clients. According to attachment theory, parental attachment relationships are enduring, affective bonds between individuals and their primary caregiver formed during childhood (Bowlby, 1969, 1988; Bretherton, 1992). Parental attachments have been important to counselors for years because of their known associations with psychological well-being, emotional well-being, interpersonal relationships, and social adjustment (Ferry,

Differences in mood instability in patients with bipolar disorder type I and II: a smartphone-based study

Bipolar disorder is characterized by recurrent episodes of depression and (hypo)mania and in the form of sub-syndromal mood swings. A substantial proportion of patients with bipolar disorder does not experience full remission, remains symptomatic during inter-episode periods and experience daily mood swings above

2. New Frontiers for Conditional Release: Applying Lessons Learned from Other Offenders with **Mental Illness**.

Academic Journal By: Gowensmith, W. Neil; Peters, Amanda J.; Lex, Indira A.; Heng, Anika K.S.; Robinson, Kevin P.; Huston, Benjamin A. *Behavioral Sciences & the Law*. Mar-Jun2016, Vol. 34 Issue 2/3, p407-422. 16p. Abstract: There is relatively little research in the literature on insanity acquittees as compared with the large number of studies focused on the supervision and treatment of probationers and parolees with **mental illness**. Ideally, the latter literature could be successfully applied to insanity acquittees discharged from an inpatient hospital on "conditional release." This article describes the challenges faced by persons on conditional release as well as the gaps in extant conditional release literature. Then, five evidence-based models for the supervision and/or treatment of probationers and parolees with **mental illness** are applied to a theoretical conditionally released population (**mental** health courts, forensic assertive community treatment teams, the risk-need-responsivity model, informed supervision practices, and HOPE probation). Benefits and limitations are noted, and recommendations for such crossover are given. Copyright © 2016 John Wiley & Sons, Ltd. [ABSTRACT FROM AUTHOR] DOI: 10.1002/bsl.2217. (*AN: 115862119*)

There is relativel	ly little research in the literature on insanity acquittees as compared
with the large nu	imber of studies focused on the supervision and treatment of proba-
tioners and parol	lees with mental illness. Ideally, the latter literature could be success-
fully applied to	o insanity acquittees discharged from an inpatient hospital on
"conditional rele	ease." This article describes the challenges faced by persons on condi-
tional release as v	well as the gaps in extant conditional release literature. Then, five ev-
idence-based mo	dels for the supervision and/or treatment of probationers and parolees
with mental illn	eess are applied to a theoretical conditionally released population
(mental health co	ourts, forensic assertive community treatment teams, the risk-need-
responsivity mod	lel, informed supervision practices, and HOPE probation). Benefits
and limitations	are noted, and recommendations for such crossover are given.
Copyright © 201	16 John Wiley & Sons, Ltd.
Empirical studies	s regarding insanity acquittees are relatively sparse. There has been a
surge of studies i	in the literature in the past decade regarding conditional release of in-
sanity acquittees	– specifically, which factors are most predictive of success or failure for
persons placed or	n conditional release (Green <i>et al.</i> , 2014; Vitacco <i>et al.</i> , 2008; Vitacco,
Vauter, Erickson	J, & Ragatz, 2014) as well as which factors are typically considered by
courts and evalue	ators in determining an insanity acquittees' readiness for conditional
